

GitHub Workflow Manual

1. Basic Rules

- Do not push directly to the main branch.
- Every task should be done in a separate branch.
- All code must be merged through a Pull Request (PR).
- Always update main before starting work.
- If your branch becomes outdated, update it before merging.

2. Working on a Task

Step 1 – Update the main branch

Before starting any work, update your local copy of the project.

~~~~~

`git checkout main`

`git pull origin main`

~~~~~

This ensures you start from the latest version of the code.

Step 2 – Create a branch for your task

Create a new branch from main.

~~~~~

`git checkout -b branch-name`

~~~~~

Step 3 – Work on the code

Make your changes in the project files.

When you finish a logical part of work:

~~~~~

`git add .`

`git commit -m "Short description of the change"`

~~~~~

Step 4 – Push your branch to GitHub

Upload your branch to the remote repository.

~~~~~

`git push origin branch-name`

~~~~~

After pushing, your branch will appear on GitHub.

Step 5 - Creating a Pull Request (GitHub)

After pushing your branch:

- Open the GitHub repository in your browser.

GitHub may show a message “Compare & pull request”:

- Click “Compare & pull request”.

If you don’t see it:

- Go to the Pull Requests tab.
- Click “New pull request”.
- Select:
 - base branch: main;
 - compare branch: your branch.
 - Add a short description of the changes.
 - Click “Create pull request”.

Your code is now ready to be reviewed and merged.

Situation: Another Developer Merged Code First

If another developer merges their branch before yours, your branch may become outdated.

Update your branch with the latest version of main.

~~~~~

`git checkout your-branch`

`git pull origin main`

~~~~~

Then push again **(!! If there is conflict then go to the next situation!!)**

~~~~~

`git push`

~~~~~

Your Pull Request will automatically update.

Situation: Merge Conflict

A merge conflict happens when two developers edit the same lines of code.

When you update your branch, Git may show:

“CONFLICT (content): Merge conflict in filename”

Git will mark the conflicting code like this:

<<<<<< HEAD

your code

=====

other developer's code

>>>>>> main

How to fix it:

- Open the file with the conflict.
- Decide what the final code should look like.
- Remove the conflict markers (or just press which change you want to keep):

```
<<<<<<<
```

```
=====
```

```
>>>>>>>
```

- Save the file.
- Then commit the changes (either each file after you resolve each conflict or after you are done with every conflict) by doing the **Step 3**
- Push like this:

```
~~~~~
```

```
git push -u origin FLAME
```

```
~~~~~
```

The conflict will now be resolved.

6. Merging the Pull Request

Napište mi láskavo na instagram, že ste spravili zmeny, nech ich skontrolujem.

Ak bude situácia, že neodpisujem alebo potrebujete robiť ďalej a nemôžete na mňa pokiaľ tak pokračujte nasledovne:

- Open the Pull Request on GitHub.
- Click “Merge pull request”.
- Click “Confirm merge”.

Your changes will now be merged into the main branch.
